# Importance of electromagnetics

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

The relief well was navigated with 3D EM

OVERVIEW The bottom kill operation involved drilling two relief wells, the second as a backup in case the first failed. The bottom kill was achieved by pumping cement into the base of the wellbore just above the reservoir.

After Marshall, L., 2011

## How I got started – 1980 - Colorado

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

- How did I get started? 1980 Dotzero Volcano, CO survey

- Same problem: truck & generator  
→ 1981 Group 7 Inc.

## How I got started – 1981 – AZ- CO - CA

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

- G7I: Many problems: Software too complicated/slow; Trucks unreliable; sensor (SQUIDs) too complicated/uncalibrated; MT versus Lotem, TX 0.5 to 1 MW BUT. Data looks very strong – not smart

**ALWAYS challenged by boreholes**

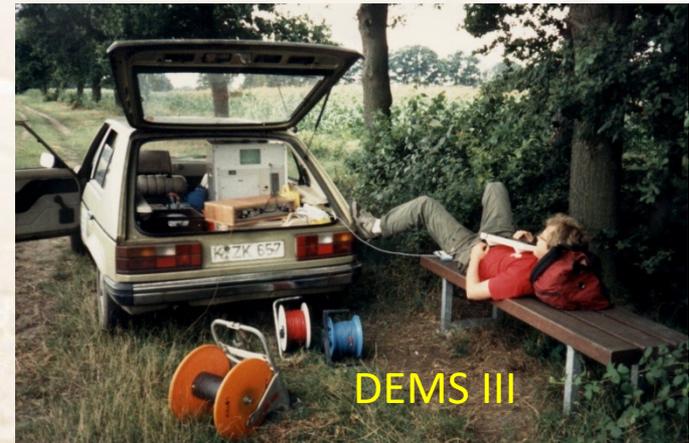

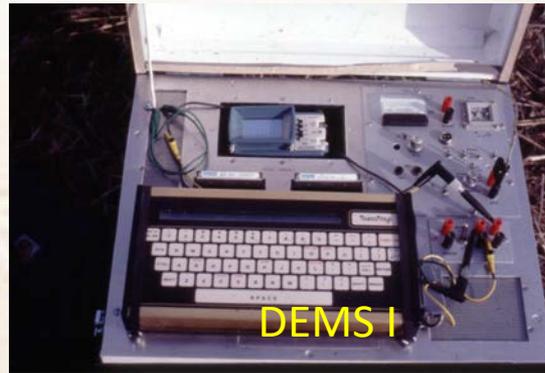

## How I got started – 1982 – NEW concepts – hard to tests

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

- NEW ideas: follow seismic experience – dense data – cheaper system 1000 receivers (my boss thought I was NUTS)  
smaller sensors → coils ; new amplifiers; WWVB – GPS; portable computers

## **Toward fluid mapping – early 1980s – Australia - Germany**

**Early years >>> Resistors – DHI >>> MORE? >>> Case histories**

- Key results: Germany - Australia work in 1980s
- Need BETTER data
- Need electric fields
- Hopeless without anisotropy

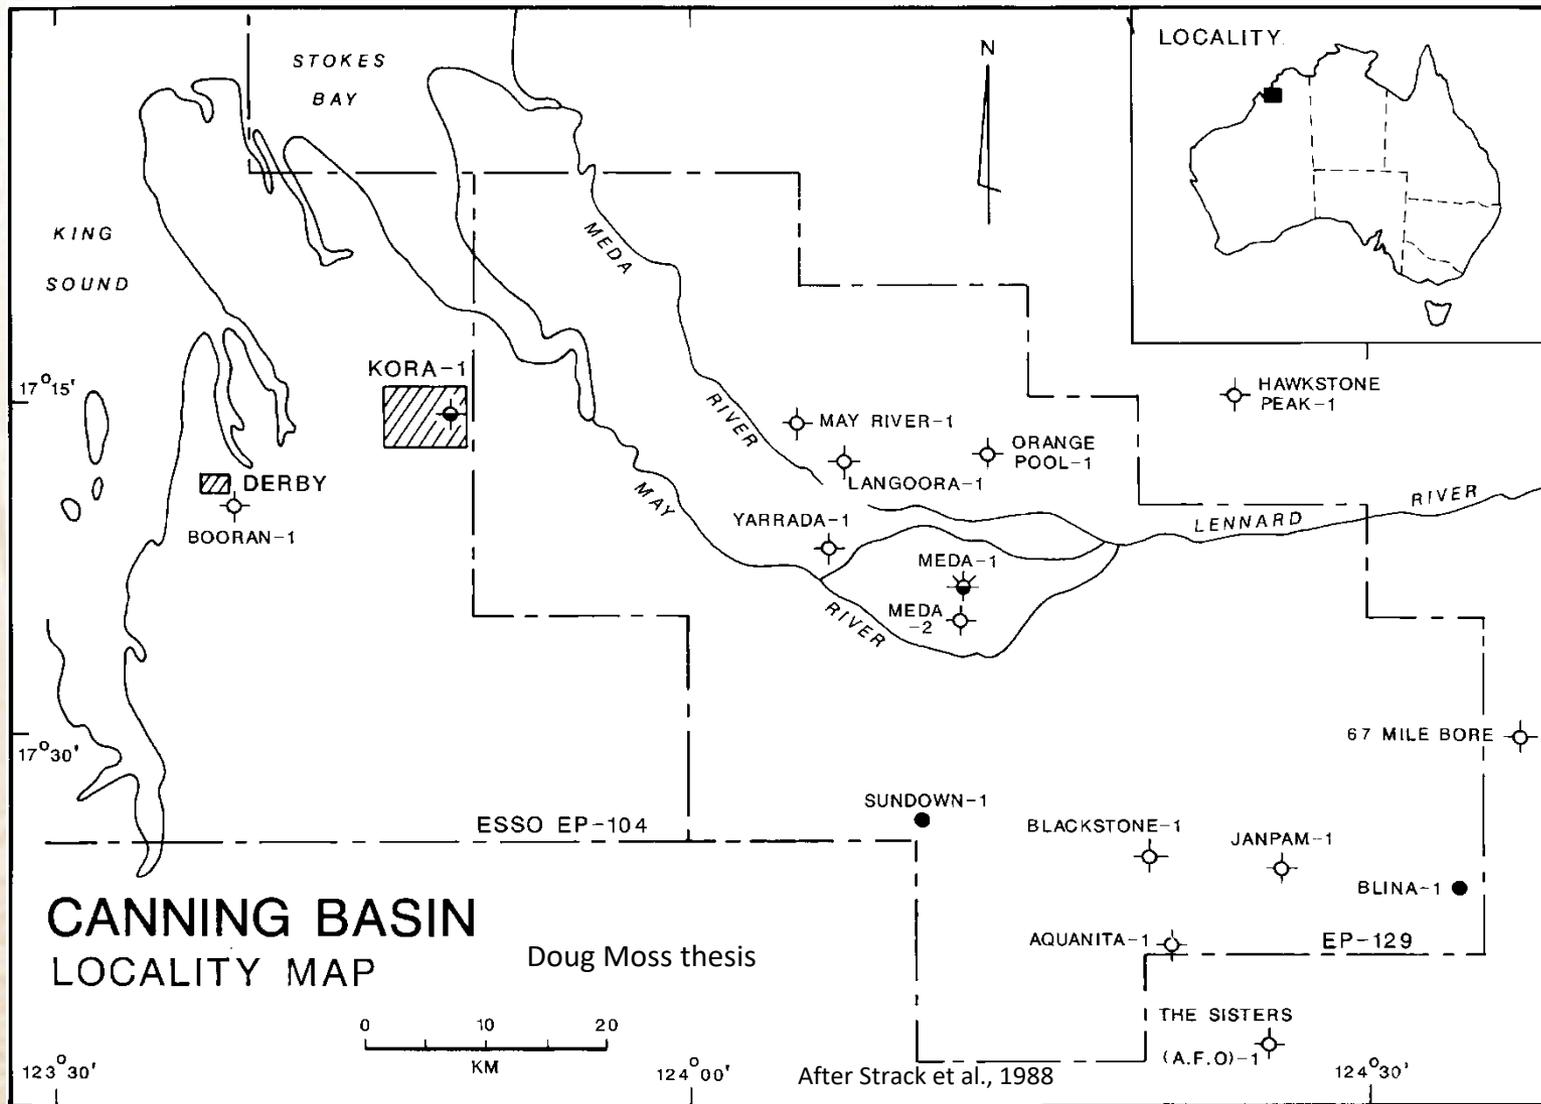

### **History:**

- Initial work at U of T & CSM (Eadie, 1979 and Passalacqua, 1979). M.Sc & Ph.D. Strack et al. 1989. First land CSEM case histories
- Eidesmo et al. 2002, Ellingsrud et al. 2002. First marine theory and examples.
- NOW standard for offshore & onshore

# Canning Basin, Australia base map

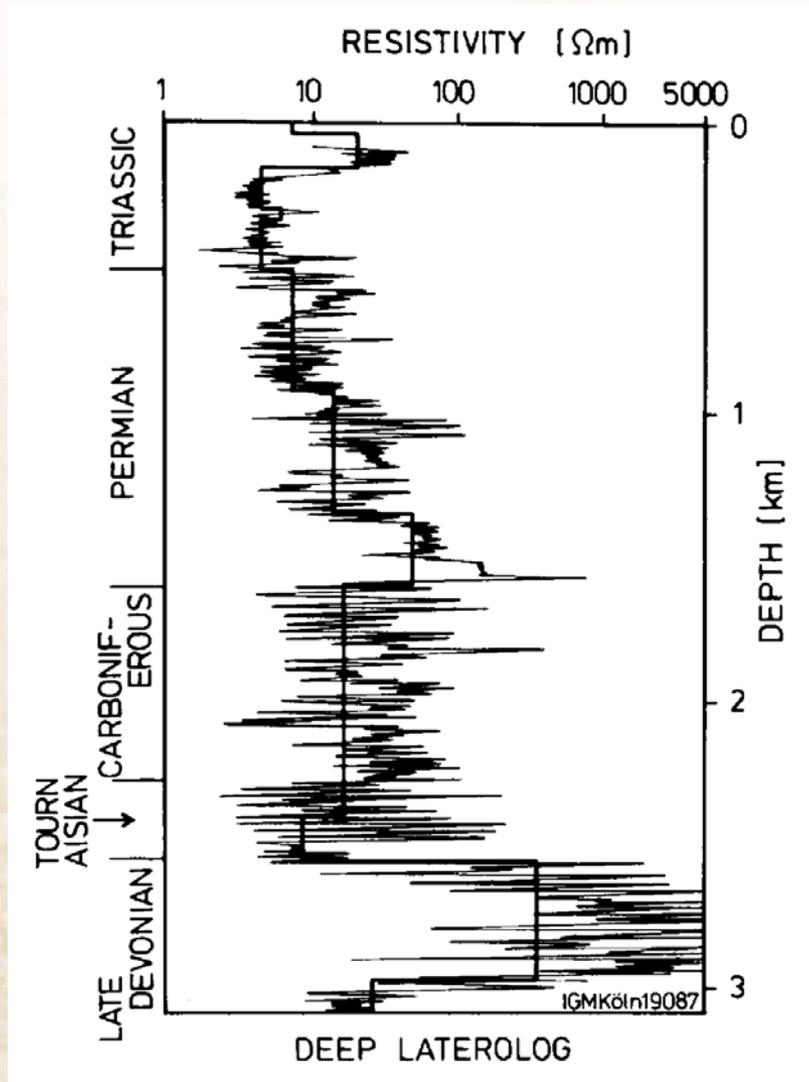

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

## Canning Basin: well 2 log

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

- 22 layers were used
- WE laughed in 1980s
- TODAY we do more & full anisotropy

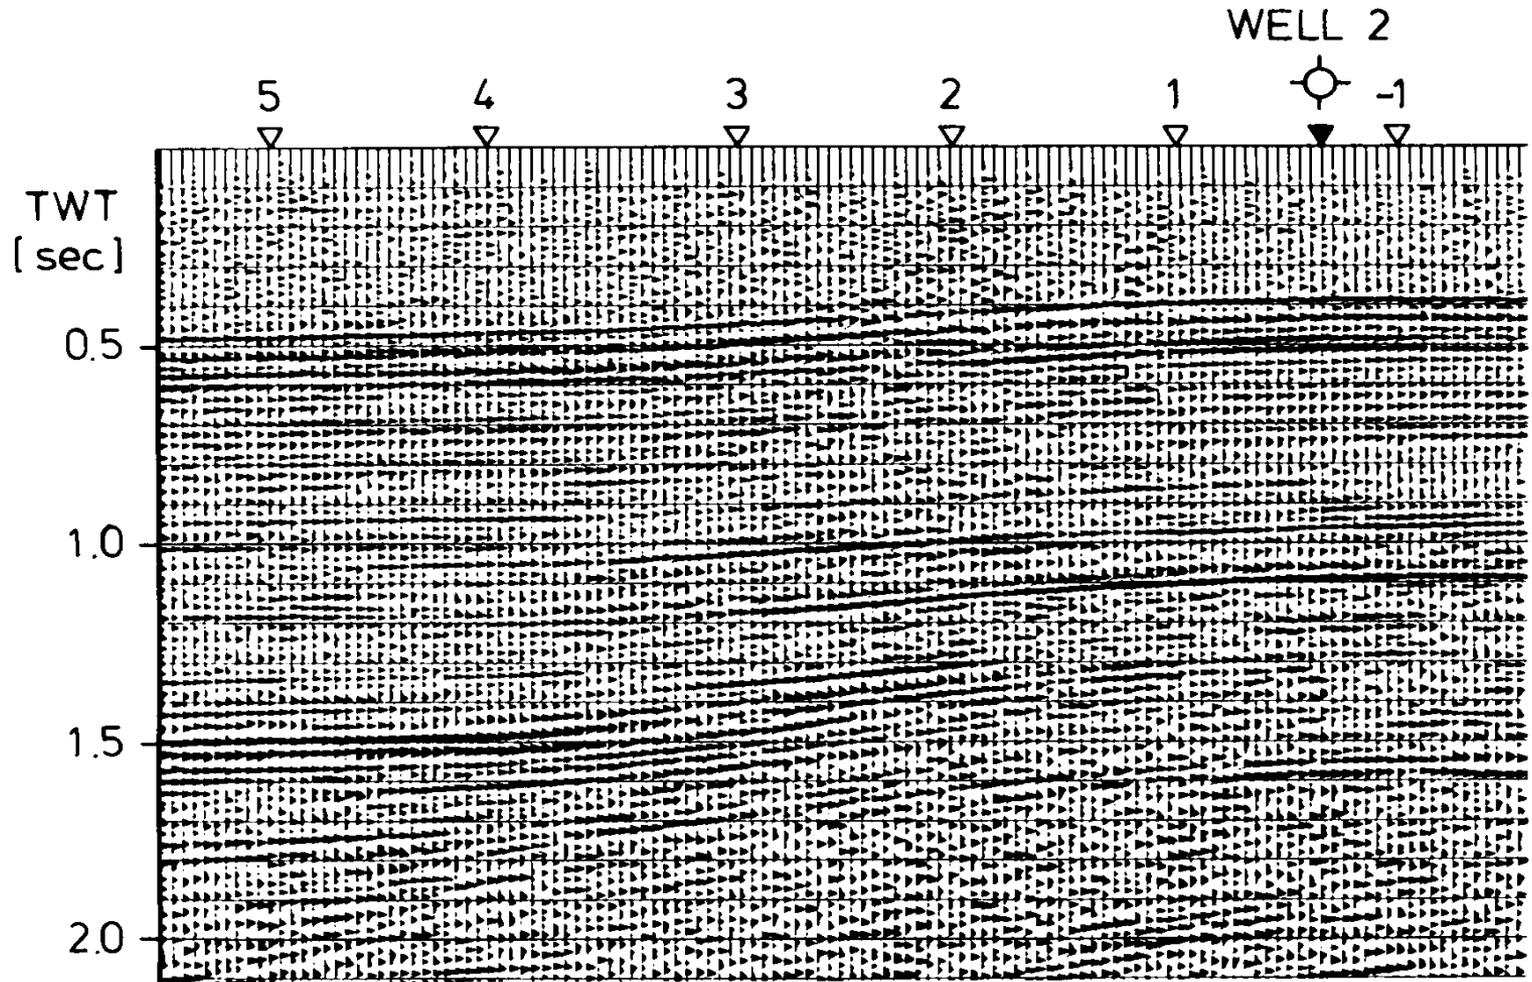

Doug Moss thesis,

After Strack et al., 1988

## Canning Basin: seismic section

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

IGMKöln20087

⚡  
▽ LOTEM RECEIVER STATION

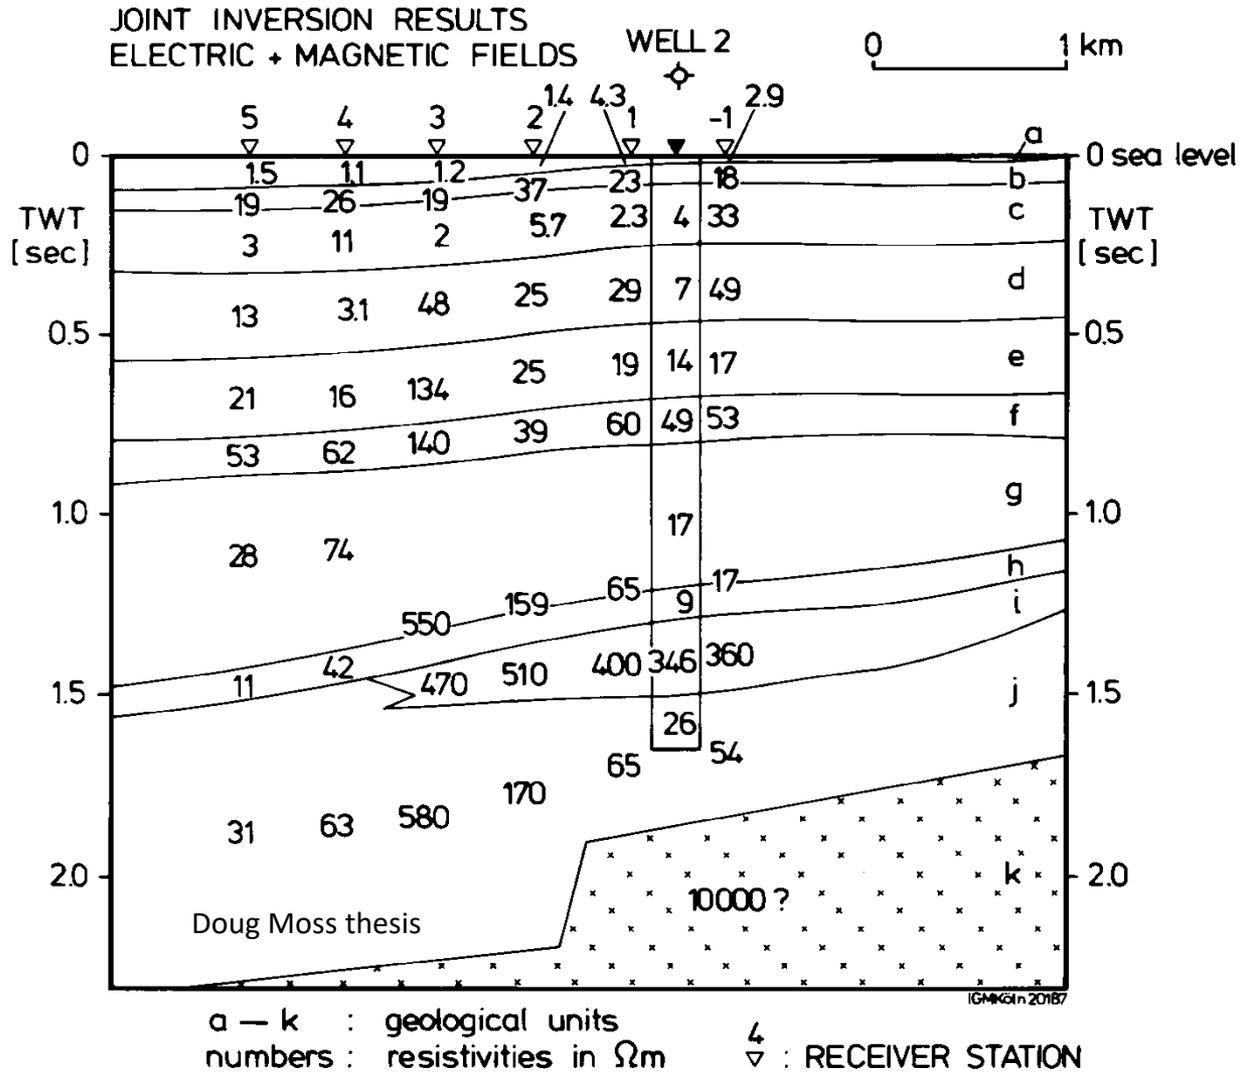

Doug Moss thesis

After Strack et al., 1988

# Canning Basing: joint inversion results

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

After Strack et al., 1988

## Southern Germany

Early years >>> **Resistors – DHI** >>> MORE? >>> Case histories

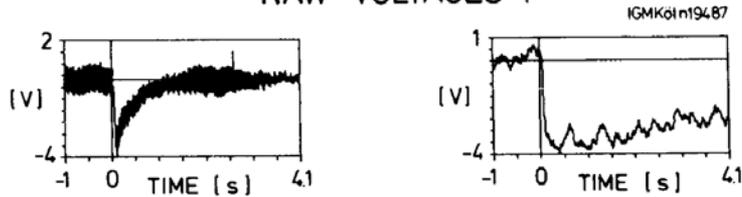

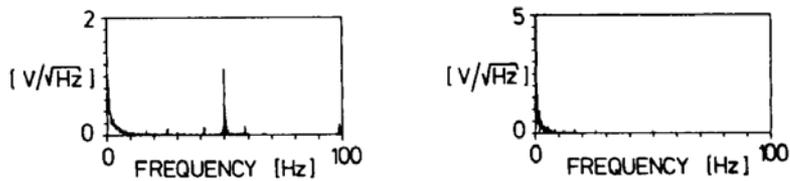

# Germany: Data examples H & E

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

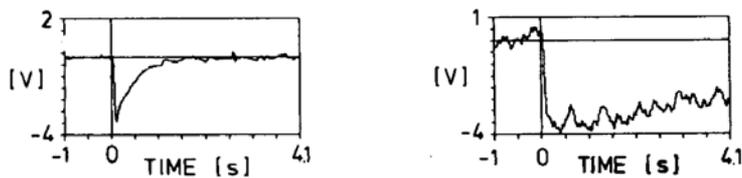

RAW VOLTAGES :

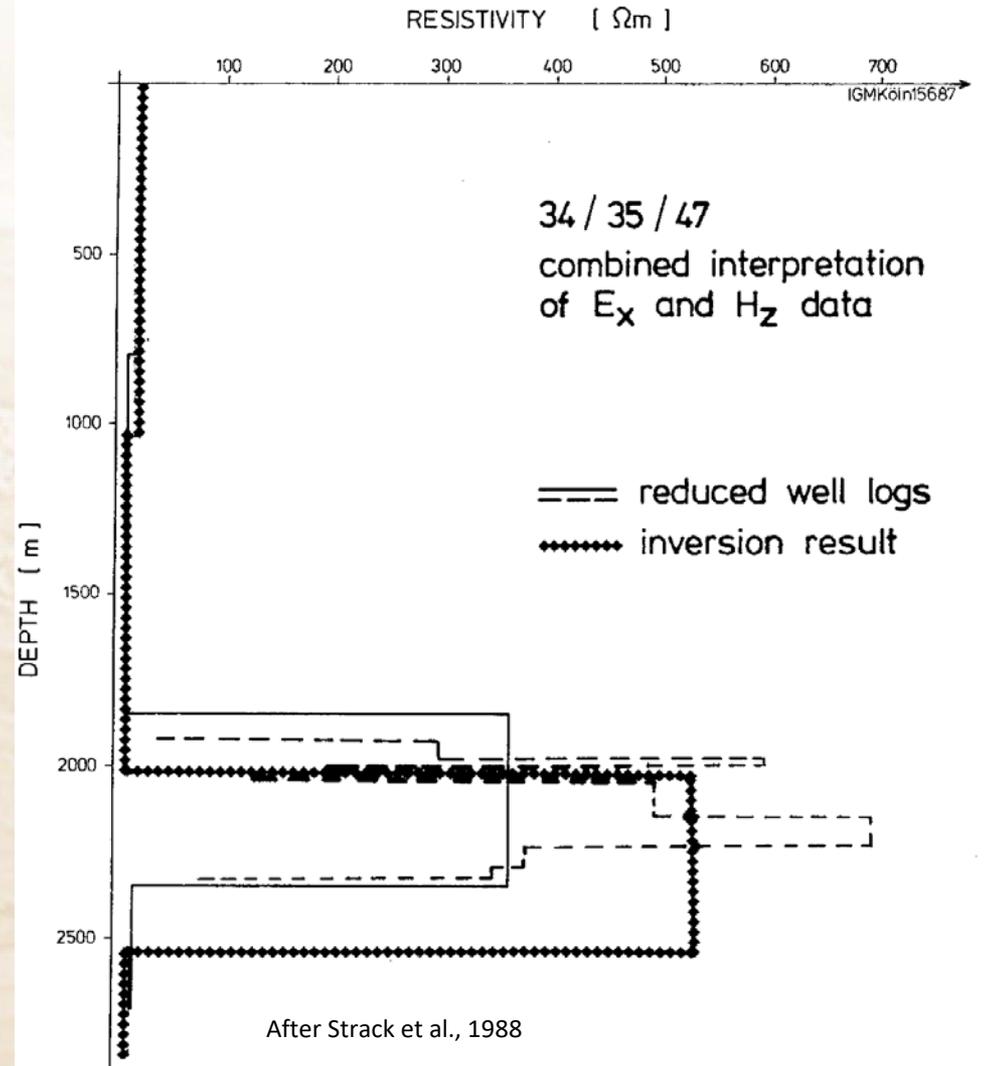

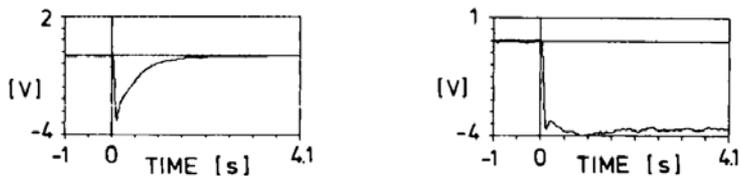

AMPLITUDE SPECTRA :

PROCESSED DATA :

SELECTIVELY STACKED DATA :

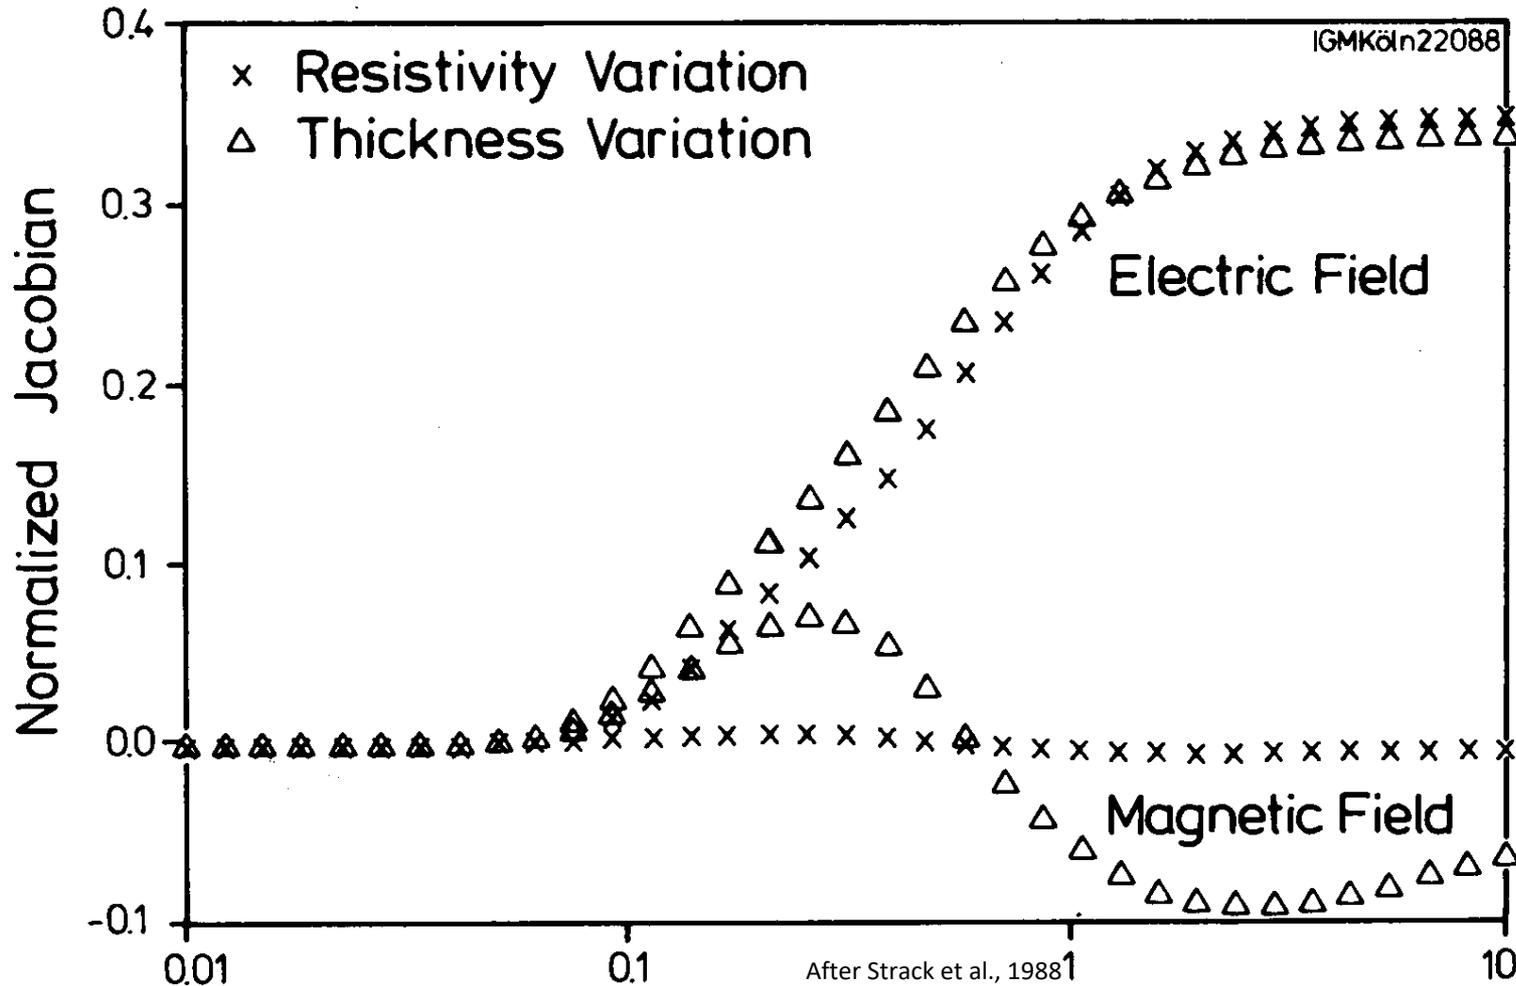

## Germany: layer sensitivity – E → resistor

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

### Sensitivity to Resistive Layer

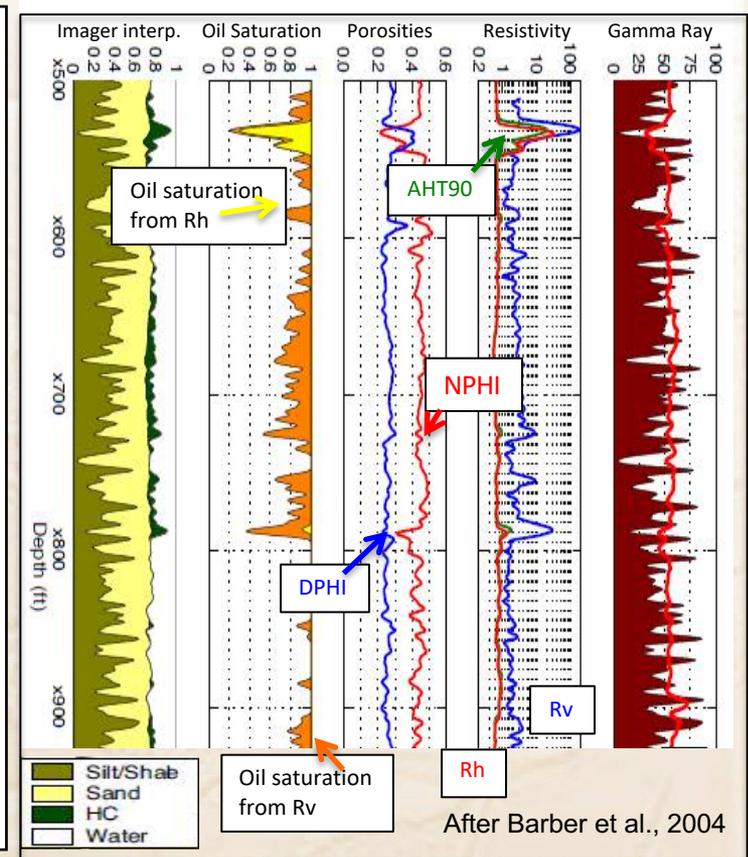

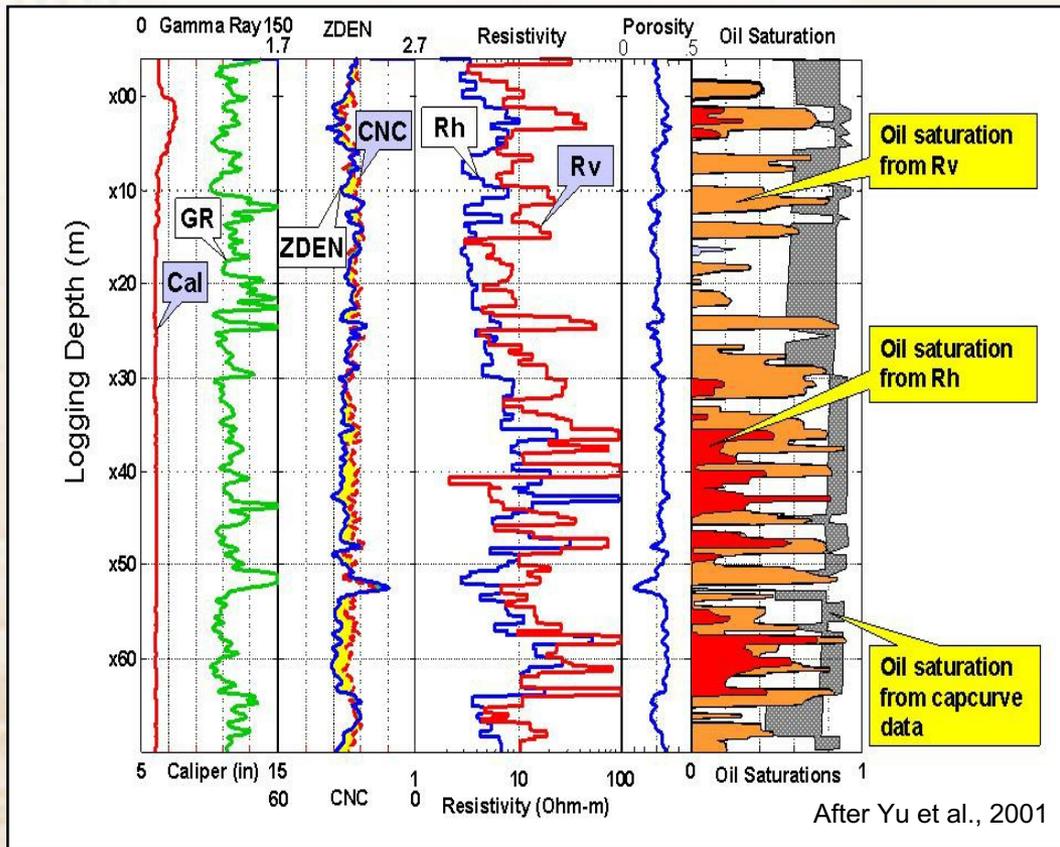

# What are we missing: dense data and anisotropy

Early years >>> Resistors – DHI >>> **MORE?** >>> Case histories

- 1990 s monitoring started – limited success (anisotropy – 40% error)
- Development of 3D induction log KEY – 40 % more oil

## Exploration – seismic integration- **China** - India – Europe - USA

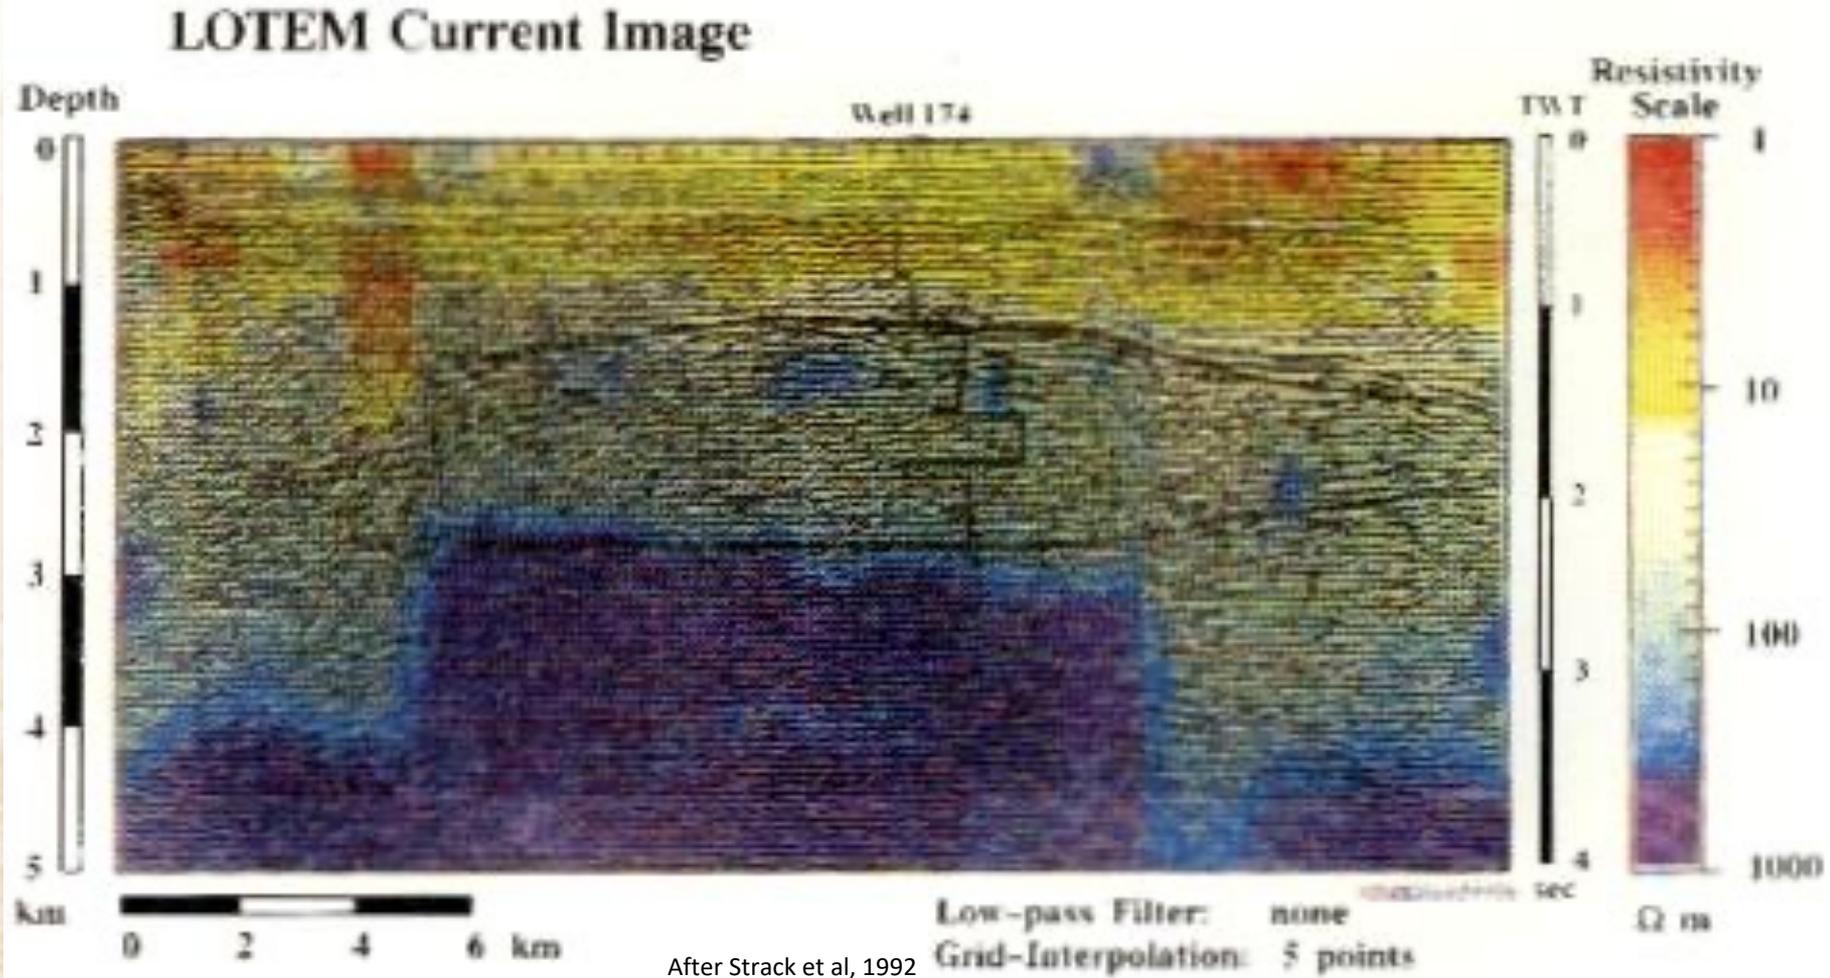

Early years >>> Resistors – DHI >>> MORE? >>> **Case histories**

- Map subsurface where seismic is bad
  - Here carbonates & poor seismic
- Great difficulty in inversion
- Data quality good → tested imaging

# Exploration – seismic integration- **China** - India – Europe - USA

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

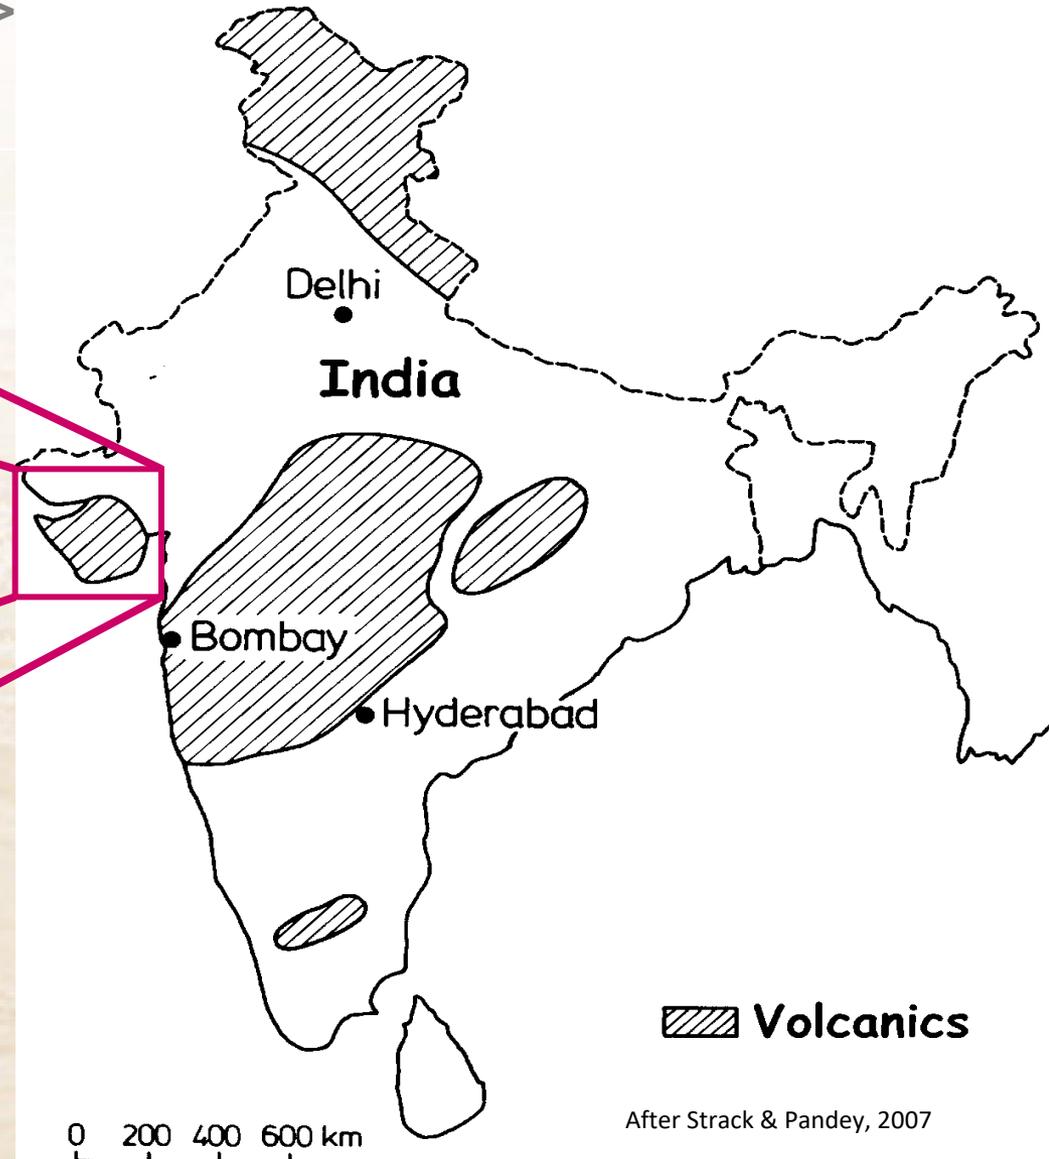

- Seismic has great difficulties
  - High velocities
  - Diffuse scattering
- Basalt is very resistive (20 – 400 Ohm-m)
  - When hot >>conductive
- Contrast to sediments is high
- Target in most cases is conductive sediments
- Difficult to see hydrocarbon in sedimentary section below basalt

# Exploration – seismic integration- China – India/Brazil – Europe - USA

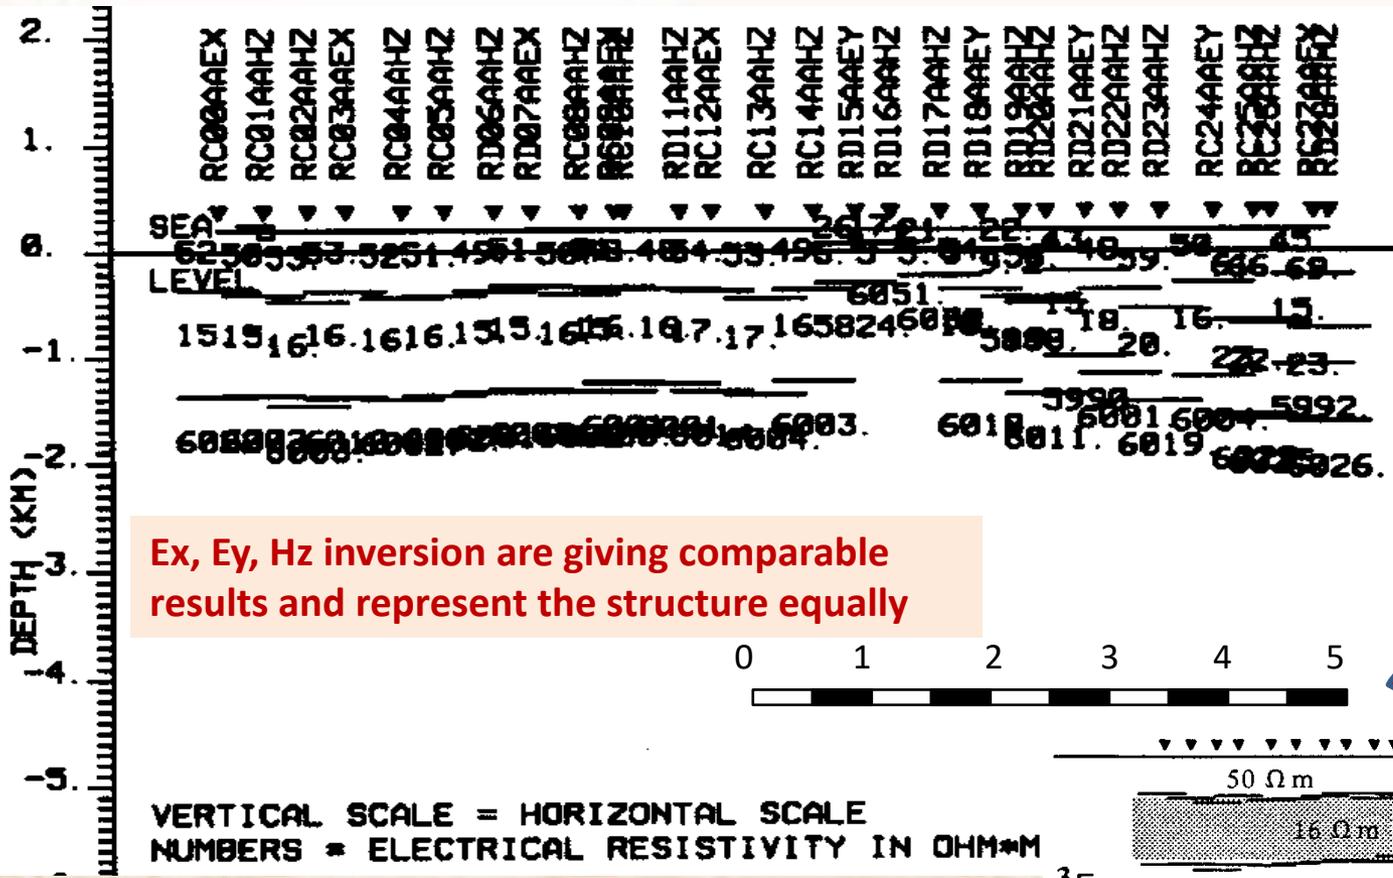

Early years >>> Resistors – DHI >

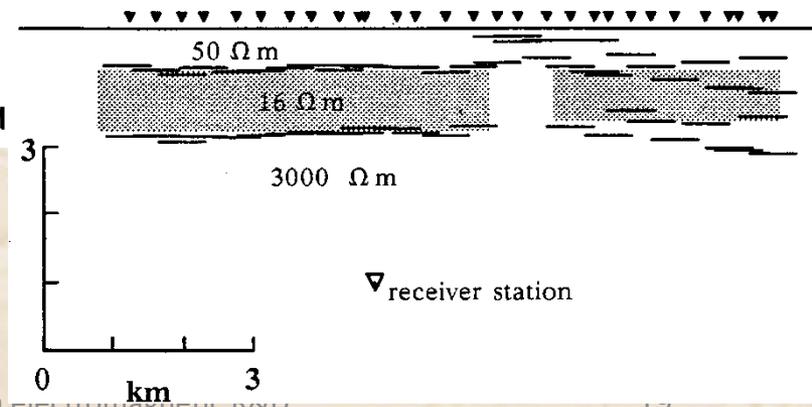

# Exploration – seismic integration- China – India/Brazil – Europe - USA

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

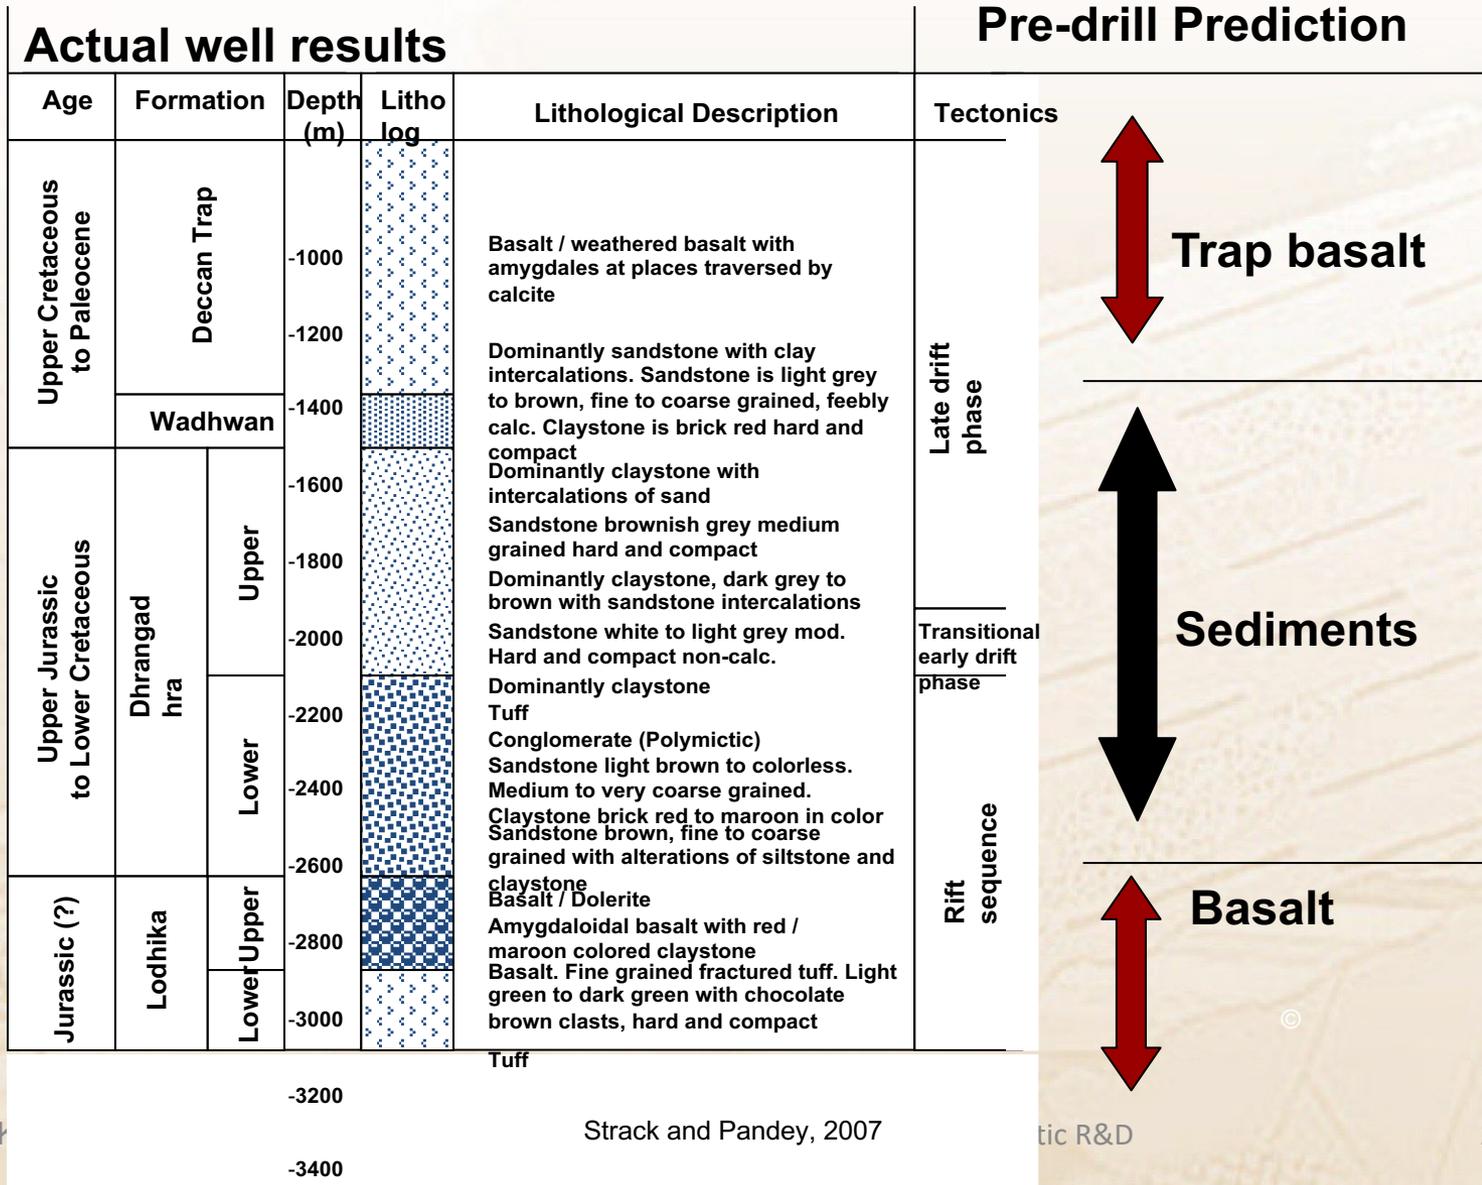

Ex, Ey, Hz inversion are giving comparable results and represent the structure equally

compiled version

# Exploration – seismic integration- China – India/Brazil – Europe - USA

## Early years >>> Resistors – DHI >>> MORE? >>> Case histories

## Actual well results

- Lotem interpretation done w/ ONGC
  - Well drilled on results
  - ONGC claims Lotem predictions are within 90-95% certainty.
- 
- Survey was designed using Feasibility modeling 3 years BEFORE survey – ALL CORRECT

# Exploration – seismic integration- China – India/Brazil – Europe - USA

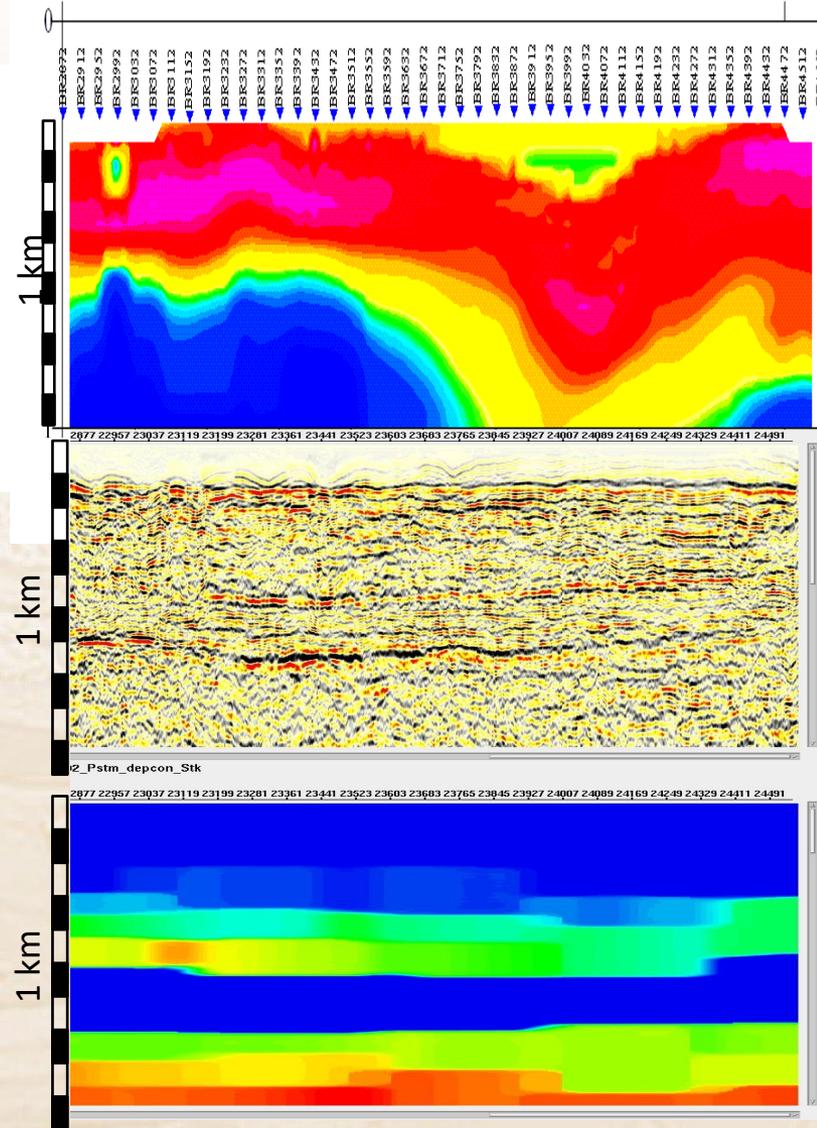

## Early years >>> Resistors – DHI >>> MORE? >>> Case histories

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

1.2 km

## Conclusion & Future: THE PATH

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

- Technology path over 40 years
  - Sensors: SQUIDS (>100 k\$) → FG (5 k\$)
  - TX: 0.5-1 MW → 200 kW
  - DAU: custom → 27 bit FP → 24 → 32 bit
  - Manual processing 20 Hz 8 sites/crew (30 min) → continuous time series to Cloud at 1 kHz, unlimited (4-5 hours normal)
  - Slow 1D inversion – unsupervised anisotropic inversion & 3D modeling

## Conclusion & Future: THE PATH

Early years >>> Resistors – DHI >>> MORE? >>> Case histories

- EM works – MT or CSEM; rarely seen bad data
- Dense data allow integration with seismic
- Formal integration still needed
- BOREHOLE → better images
- Anisotropy – otherwise 30-50% error
- CLOUD usage revolutionizes acquisition  
→ processing → 3D modeling

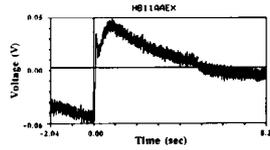

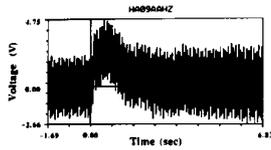

# Old (1989) processing versus new (2022)

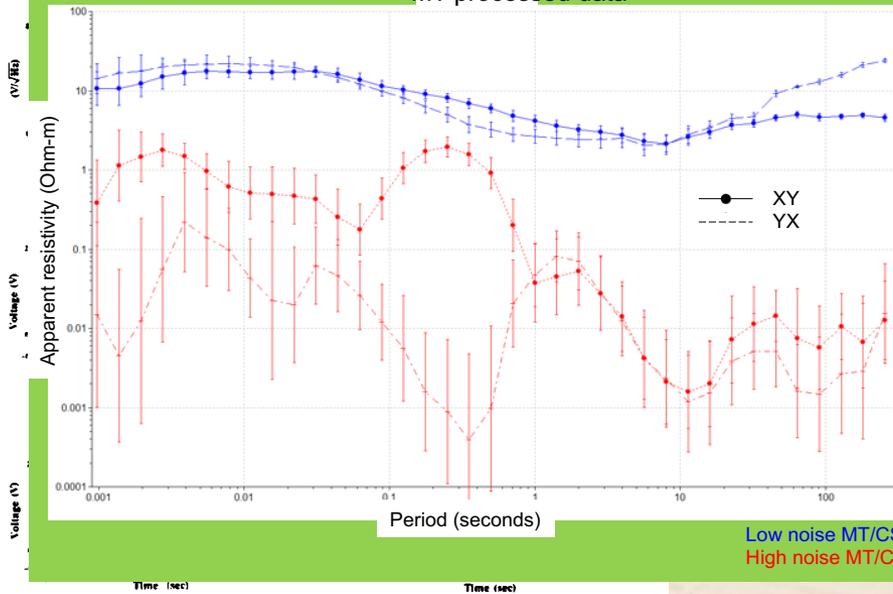

MAGNETIC FIELD ( $\dot{H}_z$ )

ELECTRIC FIELD ( $E_x$ )

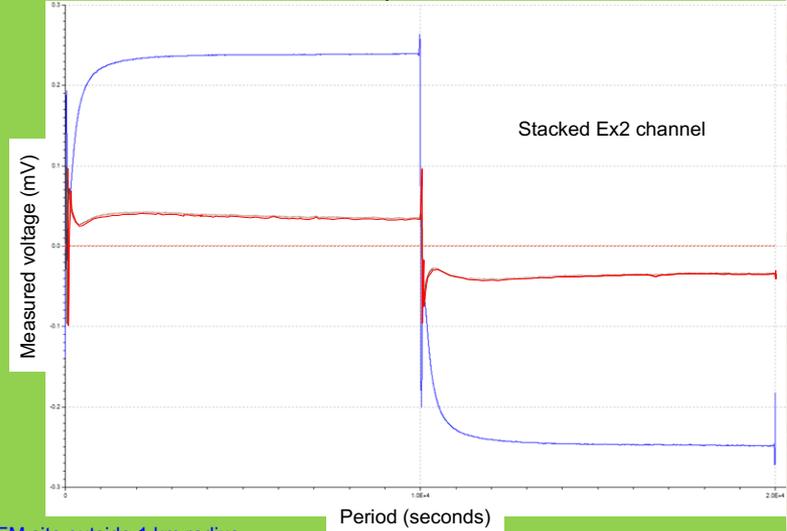

RAW VOLTAGES

MT processed data

CSEM processed data

Low noise MT/CSEM site outside 1 km radius  
High noise MT/CSEM site inside 1 km radius

## Old (1981) hardware versus new (2022)

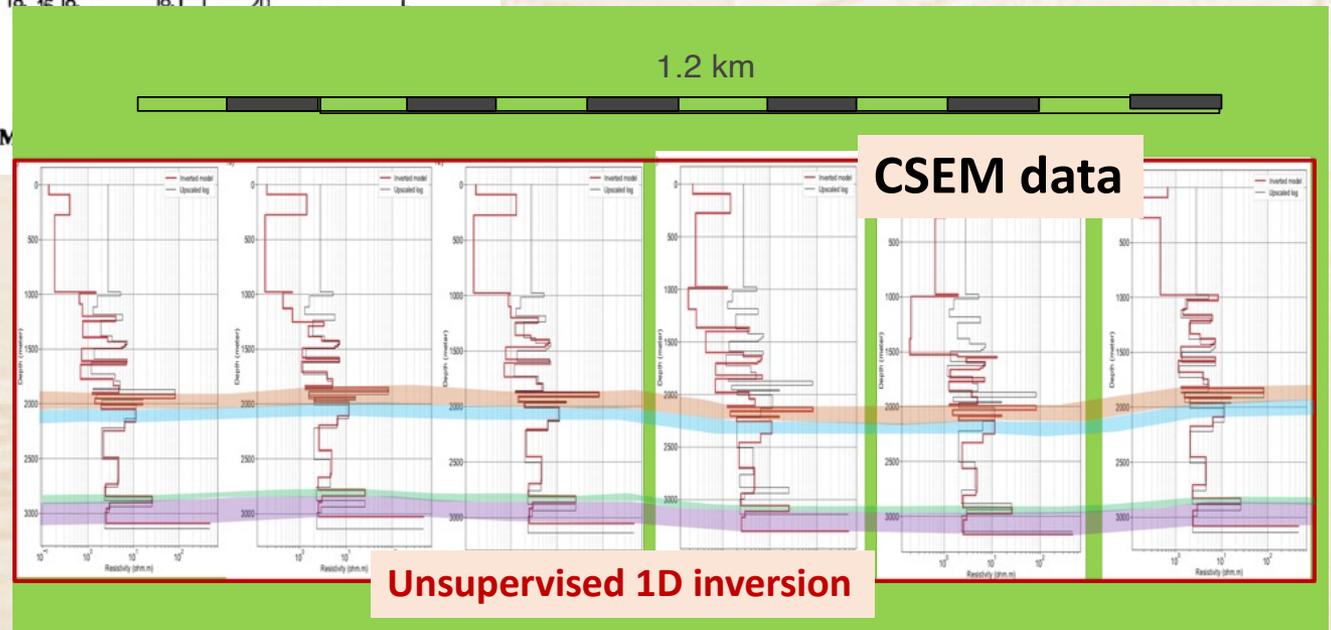

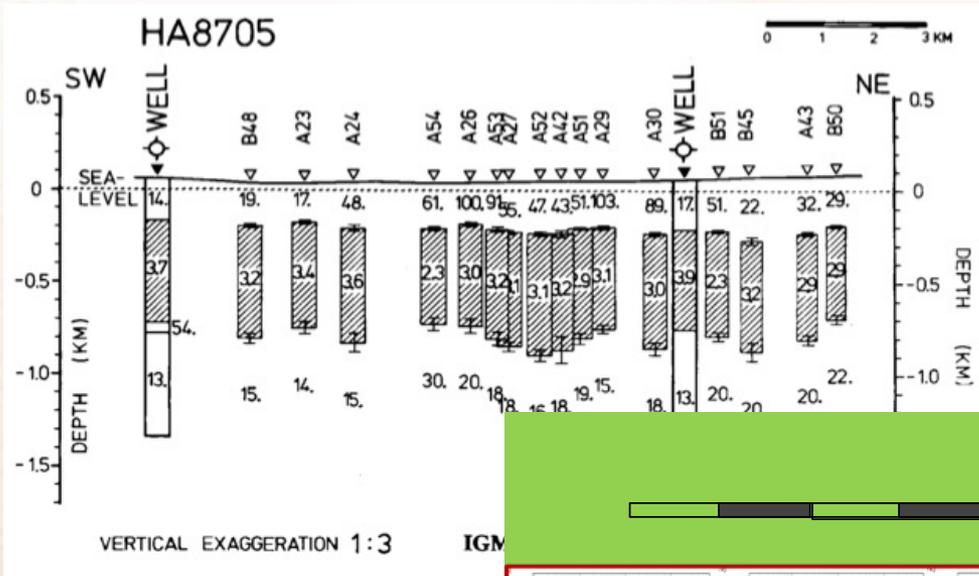

### ARRAY Electromagnetics

- 195 channels, wifi, wireless or LAN
- 3C magnetic field (DC to 40 kHz)
- 3C microseismic
- 2C electric fields
- Shallow borehole (microseismic/EM)

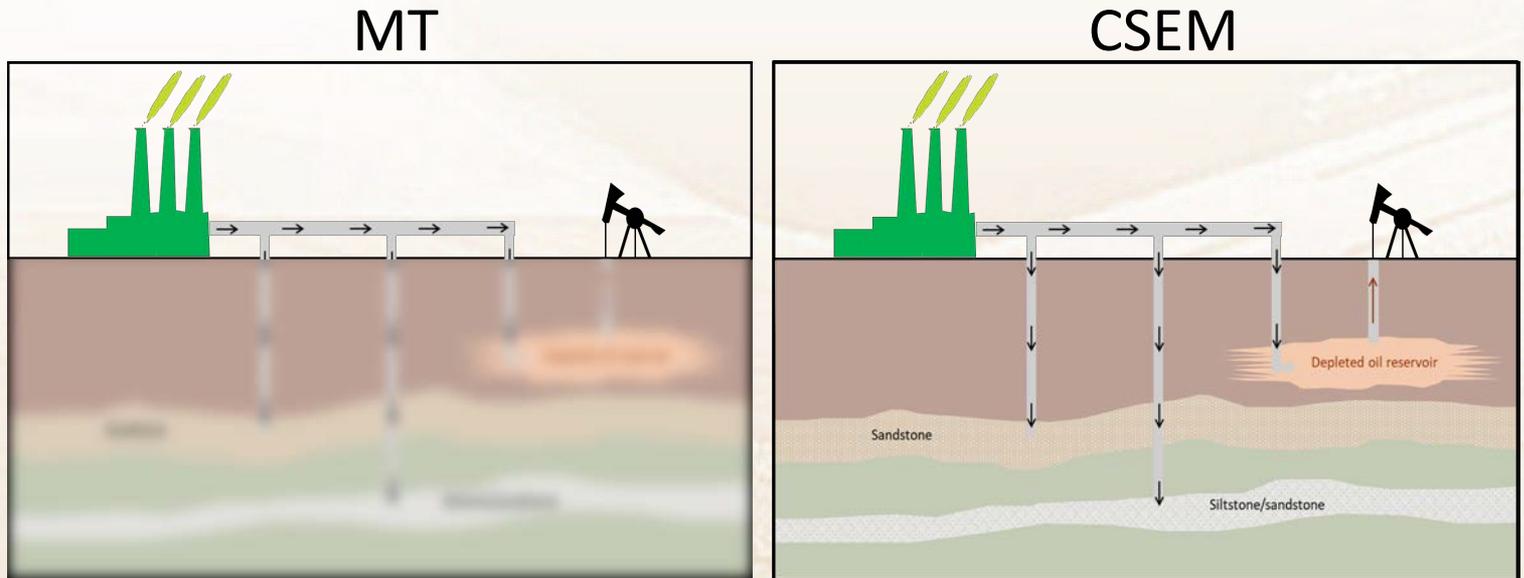

# Old (1989) processing versus new (2022)

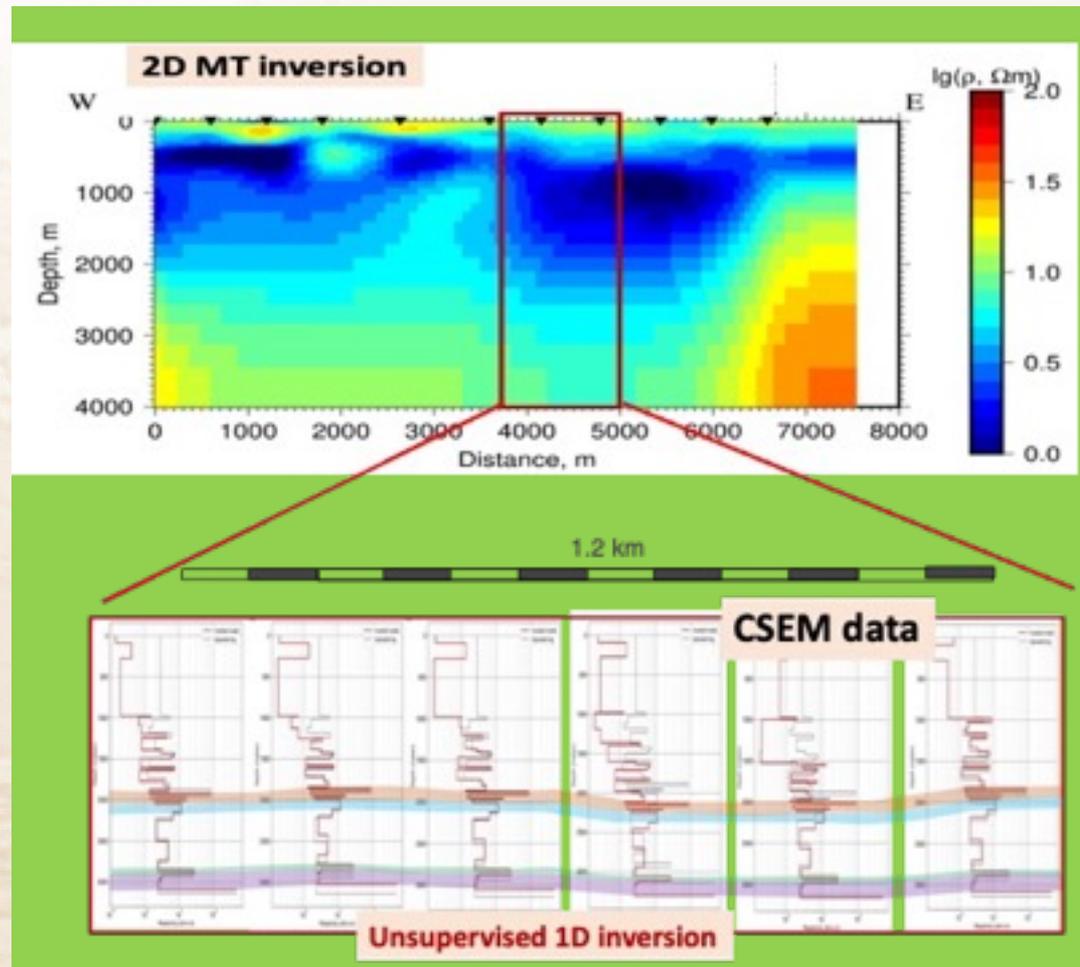

## MT & CSEM good and bad data

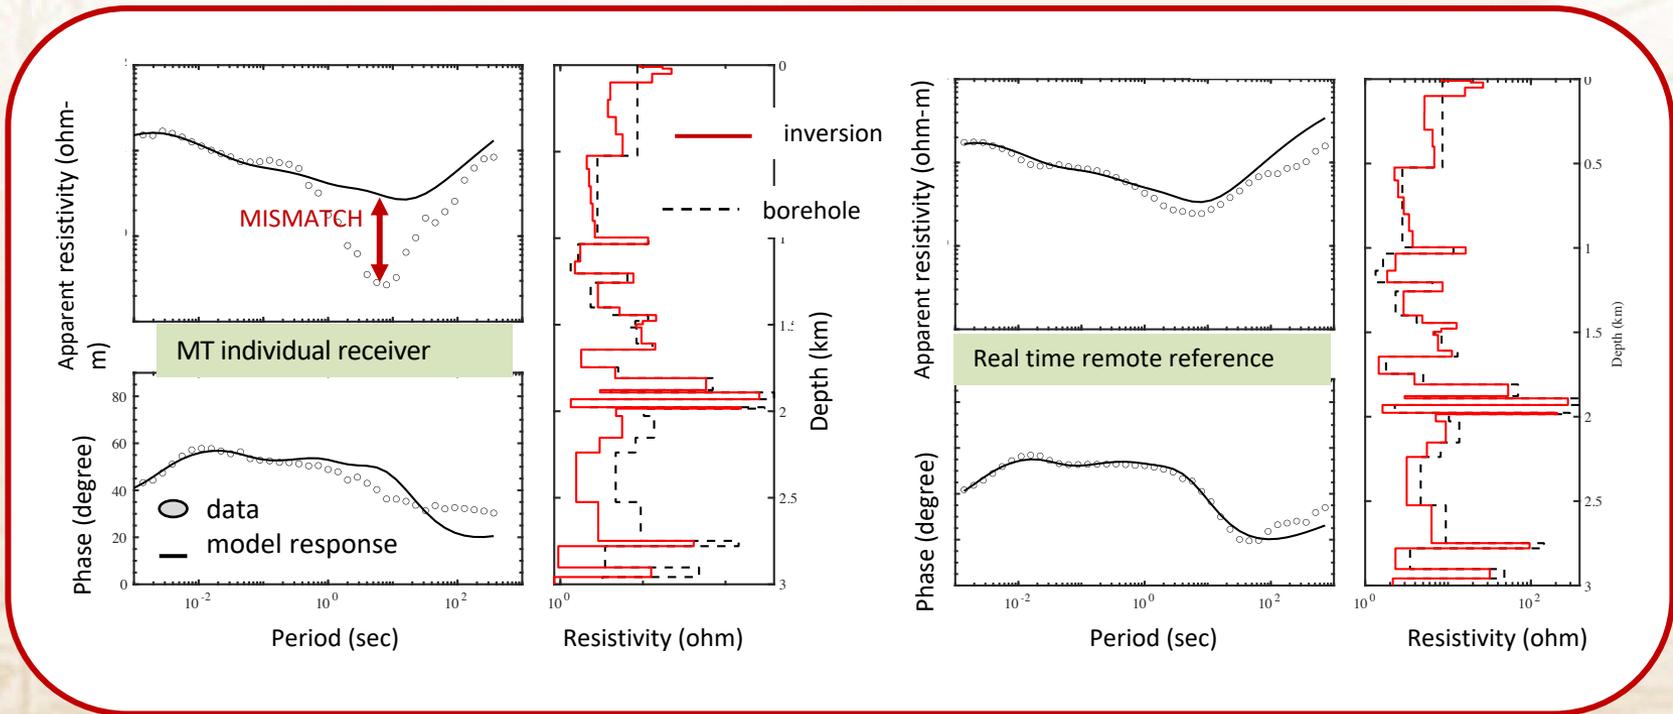

## MT & CSEM good and bad data

# The CLOUD is revolutionizing the future
